NOVELTY - A bioactive sol-gel solution comprising a biocompatible polymer (a), a gelable inorganic base material (b), and at least one calcium and phosphorous molecular species (c), is new.
DETAILED DESCRIPTION - INDEPRINERY CIAINS are also included for:
(1) a bioactive glass composite comprising (a) and (c); and
(2) formation of a bioactive glass involving mixing (a) - (c), and therapeutic compound in an encapsulated microparticle composition that, when exposed to a selected target stimulus related to ph, temperature, radiation, or the presence of a selected ligand or ion-channel activator, decondenses to release compound into the target site. > atherosclerosis and neurodegenerative disease are also provided preventing certain diseases and disorders, particularly cancer,

vector encoding an EGS is administered to an animal or human harboring antibiotic resistant bacterial cells such that the EGS is appressed in the bacterial cells, the EGS promotes RNAase P-mediated cleavage of RNA involved in conferring antibiotic resistance to the cells, and the cells are rendered antibiotic sensitive. A preferred form of administration is via inoculation of the animal or human with cells containing genes for appropriate EGSs on promiscuous plasmids. These plasmids will spread quickly through the antibiotic-resistant population of bacterial cells, thereby making the cells susceptible to antibiotic therapy.

The present invention provides novel polynucleotides encoding human phosphatase polypeptides, fragments and homologues thereof. Also provided are vectors, host cells, antibodies, and recombinant and synthetic methods for producing said polypeptides. The invention terther relates to diagnostic and therapeutic methods for applying these novel human phosphatase polypeptides to the diagnosis, treatment, and/or prevention of various diseases and/or disorders related to these polypeptides, particularly cardiovascular diseases and/or disorders. The invention further relates to screening methods for identifying agonists and antagonists of the polynucleotides and polypeptides of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a novel "***protein***, TRI7, which is a mamber of the tumor necrosis factor (NTF) receptor superfamily. In particular, isolated muctaic acid molecules are provided encoding the human TRI7. TRI7 polypeptides are also provided as anti TRI7 antibodies and vectors, host cells and recombinant methods for producing the same. The invention further relates to methods of killing cells using the antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Division of Ser. PRAI DT FS LREP 2252 Z Continuation of Ser. No. US 2001-830972, filed on 24 Sep 2001, PENDING A 371 of International Ser. No. WO 1999-US26160, filed on 5 Nov 1999 US 1998-107446P 19981106 (60) Soluble glycosaminoglycanases and methods of preparing and using soluble \*\*\*protein\*\*\* products, as well as derivatives and analogs thereof. Production of Nogo proteins, derivatives, and antibodies is also provided. The invention further relates to therapeutic compositions and for producing said polypeptides. The invention further relates to diagnostic and therapeutic methods for applying these novel BGS-18 polypeptide to the diagnosis, treatment, and/or prevention of various diseases and/or disorders related to these polypeptides. The invention further relates to screening methods for identifying agonists and antagonists of the polymucleotides and polypeptides of the present The present invention provides novel polynucleotides encoding BGS-18 polypeptide, fragments and homologues thereof. Also provided are vectors, host cells, antibodies, and recombinant and synthetic methods DAVIS, BRISTOL-MYERS SQUIBB COMPANY, PATENT DEPARTMENT, P O \*\*\*protein\*\*\* sequences of Nogo genes and methods The present invention relates to the gene, Nogo, its encoded Polynucleotides encoding a novel human Kupffer cell receptor \*\*\*protein\*\*\* , BGS-18 JONES DAY, 222 EAST 41ST ST, NEW YORK, NY, 10017, US Number of Claims: 42 STATES Schwab, Martin E., Zurich, SWITZERLAND Chen, Maio S., Zurich, SWITZERLAND The University of Zurich (non-U.S. corporation) US 2002566016 A1 20051124 US 2005-44899 A1 20050126 (11) Wu, Shujian, Langhorne, PA, UNITED STATES

Z0001017 (60) alleviate glycosaminoglycan associated pathologies. Minimally active polypeptide domains of the soluble, neutral active sHASEGP domains are described that include asparagine-linked sugar moleties required for a functional neutral active hyburonidased domain. Included are modified amino-terminal leader peptides that chiance secretion of sHASEGP. The invention further comprises sislated and pegylated forms of a combinant sHASEGP to enhance stability and serum pharmacokinotics over naturally occurring slaughterhouse enzymes. Further described are suitable formulations of a substantially purified recombinant sHASEGP glycoprotein derived from e eukaryotic cell that generate the proper LA. CAY 10953
CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention relates to the discovery of novel soluble neutral active Hyaluronidase Glycoproteins (sHASEGFs), methods of manufacture, and Hyaluronidase Glycoproteins (sHASEGFs), methods of to the their use to facilitate administration of other molecules or to their use to facilitate administration of other molecules or to their use to facilitate administration. DLA PIPER RUDNICK GRAY CARY US, LLP, 4365 EXECUTIVE DRIVE, SUITE 1100, glycosylation required for its optimal activity. The present invention relates to full-length WF-HABP, WF-HABP, OE-HABP, and BM-HABP, novel members of the hyaluronan receptor family. The invention provides isolated nucleic acid molecules encoding human to full-length WF-HABP, WF-HABP, OE-HABP, and BM-HABP receptors. Full-length WF-HABP, WF-HABP, OE-HABP, and BM-HABP polypeptides are also US 2005239098 A1 20051027 US 2004-960275 A1 20041008 (10) Division of Ser. having a selected by temperature, ligand concentration or binding-molecule characteristic. The method includes entrapping the binding-molecule characteristic. The method includes entrapping the therapeutic compound in an encapsulated microparticle composition that, when exposed to a selected target stimulus related to pH, temperature, radiation, or the presence of a selected ligand or ion-channel activator, decondenses to release compound into the target site. The encapsulated microparticle composition consists of a condensed-phase particle matrix containing the compound to be delivered in entrapped form, and a stimulus-responsive lipid bilayer membrane formed around the meatrix. Localized perturbation of the lipid membrane, and influx of monovalent counterions into the polymer matrix, in response to the selected target stimulus, causes matrix swelling and compound release
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     temperature, radiation, or the presence of a selected ligand or ion-channel activator, is disclosed. The composition includes a condensed-phase particle matrix containing the compound to be delivered in entrapped form, and a stimulus-responsive lipid bilayer membrane formed around the matrix. Localized perturbation of the lipid membrane and influx of monovalent counterions into the polymer metrix, in response to the selected target stimulus, causes matrix swelling and
